

MS Qwizard – Release Notes

Version 1.10 – 13/09/2017

The behavior for the multiple selection has been changed: on the selection of the first element, using long-press, the software shows a toolbar on top of the relative queue showing the various action possible for the items. There is also a button to select and unselect all the items.

There was a mismatch in the print mode when receiving print jobs with 3 dpd with specific dotmap: as a result most B print modes were recognized as A mode.

The print mode selection menu now correctly handle the print modes @s, As and Bs.
